Message from the Guest Editors

Dear Colleagues,

The production of crop plants is one of the most ancient activities. In all ages, it has provided food, feed, and several other products that can be used for further processing. The basic task of land use for crop yield improvements is quite simple: the harmonization between crop plant requirements and production site characteristics. In general, there are several efficient yield-improving factors. There are studies focusing on management technologies such as (1) the application of different genetical backgrounded materials and the variety of usage; (2) adaptation to different agroecological environment; (3) crop rotation methods; 4) manuring and fertilization; (5) tillage methods; (6) any parameter of sowing and planting; (7) plant care and phytosanitary (including irrigation); (8) harvest methods and parameters; and (9) post-harvest technologies (including storage problems like *Fusarium* mycotoxin production).

This Special Issue aims to assess the effects of agricultural management, efficient agronomic practices, and the utilization of proper crop species and varieties on crop yield, involving crop management, land–crop systems, and yield improvement.

Message from the Editor-in-Chief

Agriculture (ISSN 2077-0472) is an international, scholarly and scientific open access journal publishing peer-reviewed research papers, review articles, communications and short notes that reflect the breadth and interdisciplinarity of agriculture.

Author Benefits

Open Access: free for readers, with article processing charges (APC) paid by authors or their institutions.

High Visibility: indexed within Scopus, SCIE (Web of Science), GEOBASE, PubAg, AGRIS, RePEc, and other databases.

Journal Rank: JCR - Q1 (Agronomy) / CiteScore - Q1 (Plant Science)
