### Message from the Guest Editors

Dear Colleagues,

An innovative approach and potent methodology for plant improvement is molecular marker-assisted breeding (MAB), which applies molecular biotechnologies (DNA markers) to practical breeding and selection. The incorporation of MAB into traditional breeding operations is an encouraging approach for crop development in the future.

Often, new crop cultivars are suggested as a viable solution for climate change adaptation. Crop wild relatives (CWRs) could be sources of genetic diversity in producing new cultivars, given they have been used for crop improvement regarding disease and pest resistance as well as abiotic stress tolerance. We can use a more efficient form of selection to domesticate more wild species as we learn more about the genetic and biological basis of domestication processes. As we face climate change, this could lead to the development of novel crops and help us accomplish more environmentally sustainable agriculture, since many wild taxa are genetically diverse and locally adapted to certain ecosystems.

## Message from the Editor-in-Chief

*Agriculture* (ISSN 2077-0472) is an international, crossdisciplinary and scholarly open access journal on the science and technology of crop and animal production, and management of the natural resource base for agricultural production. *Agriculture* is published in an open access format – research articles, reviews and other contents are released on the internet immediately after acceptance. The scientific community and the public have unlimited and free access to the content as soon as it is published.

## Author Benefits

**Open Access:** free for readers, with article processing charges (APC) paid by authors or their institutions.

**High Visibility:** indexed within Scopus, SCIE (Web of Science), PubAg, AGRIS, RePEc, and other databases.

**Journal Rank:** JCR - Q1 (Agronomy) / CiteScore - Q1 (Plant Science)
