Deadline for manuscript  
submissions:

**closed (10 June 2024)**

### Message from the Guest Editor

Equipped with advanced imaging sensors, UAVs can capture subtle the changes in and features of plants, providing a detailed understanding of crop health. These sensors can measure indicators such as the chlorophyll content, leaf area index, and plant height, helping farmers and researchers monitor the crop growth conditions and potential issues.

Furthermore, UAV imaging technology can also be used for crop biomass estimation and yield prediction. By collecting a large amount of UAV image data and combining image processing algorithms and machine learning techniques, researchers can establish accurate models to estimate the crop biomass and predict the yield.

This Special Issue's research articles will provide useful insights into the most recent developments in UAV imaging technology. The utilization of advanced imaging sensors and image processing algorithms is particularly important, with a specific focus on crop health, biomass estimation, yield prediction, and pest and disease forecasting. We want original research, viewpoints, and reviews to encourage a thorough conversation on this important subject.

an Open Access Journal by MDPI

## Message from the Editor-in-Chief

*Agriculture* (ISSN 2077-0472) is an international, scholarly and scientific open access journal publishing peer-reviewed research papers, review articles, communications and short notes that reflect the breadth and interdisciplinarity of agriculture.

## Author Benefits

**Open Access:** free for readers, with article processing charges (APC) paid by authors or their institutions.

**High Visibility:** indexed within Scopus, SCIE (Web of Science), GEOBASE, PubAg, AGRIS, RePEc, and other databases.

**Journal Rank:** JCR - Q1 (Agronomy) / CiteScore - Q1 (Plant Science)
