submissions:

closed (15 November 2023)

Message from the Guest Editors

Sustainably produced crops are more beneficial to the environment and consumers in comparison to commercial crops. Based on this fact, sustainable legume and oil crop production is being increasingly demanded. A significant increase in the world demand for natural protein and fat represents a great opportunity to restore agro-environment biodiversity by increasing the cultivation of legume crops and oilseed crops in areas dominated by cereals. Legumes and oilseed crops, whose beneficial role in cropping systems is widely acknowledged, are needed now more than ever to increase the sustainability of crop production. Legumes are important food and feed crops, being key components of the diet, as well as staple crops, and exert their benefits through increased biological nitrogen fixation, thus reducing energy costs and improving soil physical conditions and biodiversity. Oilseed crops are very important for the market as a source of fat for food and fodder production. Oilseed cultivation positively affects soil conditions and enhances biodiversity in cereal monoculture systems.

an Open Access Journal by MDPI

Message from the Editor-in-Chief

Agriculture (ISSN 2077-0472) is an international, crossdisciplinary and scholarly open access journal on the science and technology of crop and animal production, and management of the natural resource base for agricultural production. *Agriculture* is published in an open access format – research articles, reviews and other contents are released on the internet immediately after acceptance. The scientific community and the public have unlimited and free access to the content as soon as it is published.

Author Benefits

Open Access: free for readers, with article processing charges (APC) paid by authors or their institutions.

High Visibility: indexed within Scopus, SCIE (Web of Science), PubAg, AGRIS, RePEc, and other databases.

Journal Rank: JCR - Q1 (Agronomy) / CiteScore - Q1 (Plant Science)
