### Message from the Guest Editor

Dear Colleagues,

The results of morphological, histochemical, immunohistochemical studies are the basis of the knowledge relating to histology and anatomy and constitute the starting point for cognitive investigations aimed at verifying the changes that occurred, for example, in pathological conditions, in animals reared in different environmental conditions or subjected diets with different characteristics. The results of this research are constantly evolving also due to the use of increasingly specialized techniques and increasingly specific reagents. Furthermore, the growing interest in wild unconventional animal species has broadened the field of application of these researches and investigation techniques with interesting results also in view of a comparison with the most studied animal species.
