Message from the Guest Editors

I have the intention of launching a Special Issue of *Axioms* devoted to (1) the presentation of some new deductive systems, modified known systems and little-known systems with their specifics, intuitive foundation, and methodological or metamathematical properties (2) comparison of systems of the same scientific discipline with each other; as well as (3) a collective review of current and updated systems of the same type, taking into account discussed below all aspects and explaining their functioning in the past, present, and future (deductive systems will be understood as deductive theories and distinguished from their syntactic characterization by appropriate ordered pairs or triples).
