Deadline for manuscript  
submissions:

**31 October 2024**

### Message from the Guest Editors

Testing and assessment occurs throughout our lives, from schooling to employment. The science of psychometrics is the leading aspect of the field of psychology that has a direct impact on the daily lives of individuals. Special mention should be made for assessment instruments for measuring individual and organizational wellbeing. Tests in this field are used in professional practice as well as for research purposes. A major aspect in the assessments of individual and organizational wellbeing should be to share a common set of fundamental characteristics, that are: reliability, validity, standardization and freedom from bias. Together, these are essential to guaranteeing the quality of assessment.

This Special Issue focuses on methodological works aimed at studying the psychometric properties of tests related to the areas of individual and organizational wellbeing, as well as measurement invariance between countries or between groups of people. We welcome different types of manuscript submissions, including original research articles, cross-cultural studies and up-to-date reviews (systematic reviews and meta-analyses). For more information, please visit **Special Issue**.
