Deadline for manuscript submissions:

closed (31 May 2023)

Message from the Guest Editor

Education is a fundamental pillar in the formation of the individual and in the projection of a country. Achieving success in the teaching and learning processes is a priority factor that can have great consequences on student behavior. Different agents interact in educational systems around the world, but above all, these include teachers and students. Psychological aspects of the student himself can affect his learning. Students' engagement in activities in their free time can influence their behavior at school. Additionally, educators must have skills enabling them to design learning strategies that promote academic, personal growth and job prospects for each of their students. In this way, both agents can intervene in the behavior of students and in achieving success in the educational process. Failure to achieve academic success individually can have serious consequences. These problems can be analyzed in two major student stages, in adolescence and in the university environment. Due to these problems, it is necessary to continue exploring the causes and effects of behaviors that affect students and their learning.
