Message from the Guest Editors

Many protein complexes have been reported by researchers that they play critical roles in brain development, and abnormal levels of these complexes lead to behavioral deficits in offspring in animal models; thus, they are implicated in neurodevelopmental disorders. Investigating the role of protein complexes in neurodevelopmental disorders can improve the mechanisms of these disorders and may improve the therapeutics of related diseases. In light of these premises, this Special Issue aims to present advanced studies about protein complexes involved in neurodevelopmental disorders. We welcome all submissions related to the topics mentioned above.
