### Message from the Guest Editor

It is my pleasure to announce a new Special Issue of *Behavioral Sciences* on “Cognition in Parkinson’s Disease”. Since the recognition of nonmotor symptoms in Parkinson’s disease, cognitive impairment has attracted a lot of interest, mainly due to its impact on quality of life and daily function. I would like to invite you to collaborate in this Special Issue, including helpful information for the readers such as the epidemiology and importance of mild cognitive impairment and dementia and PD, how to make the diagnosis and which tests we should use, biomarkers including CSF and neuroimaging, as well as current treatments, drugs in development, and potential future approaches. I would also like to include the clinical semiology describing the different cognitive domains including also social cognition, a less studied field in PD but with a huge interest in social interactions in these patients.

A better recognition and approach of this disabling entity may have a huge beneficial effect on our patients. For more information, please visit: **Parkinson’s Disease and Cognition**.
