Deadline for manuscript
submissions:

closed (30 October 2023)

Message from the Guest Editors

This Special Issue aims to offer a research platform for communicating and discussing recent findings and developments in timber engineering, including wood characterisation, manufacturing of new engineered timber products, densification of timber, development of adhesive system, and use of end-of-life timber.

The aim of this Special Issue is to attract prominent research groups to share and contribute to the body of knowledge in this field by presenting their findings related to analytical, numerical, and/or experimental investigation of timber engineering, thus creating sustainable and resilient communities. The topics relevant to this Special Issue include, but are not limited to:

- Densification of timber;
- Characterization of densified timber;
- Repurposing end-of-life timber;
- Material characterisation of various wood species;
- Engineered mass timber panels using softwood and hardwood;
- Development and use of bio-resin for mass engineered products;
- Veneer based timber products;
- Recent development in nail laminated timber, laminated veneer lumber, plywood, and oriented strand board.

Message from the Editor-in-Chief

Current urban environments are home to multi-modal transit systems, extensive energy grids, a building stock, and integrated services. Sprawling neighborhoods are composed of buildings that accommodate living and working quarters. However, it is expected that the cities and communities of the future will face complex and enormous challenges, including maintenance, interconnectivity, resilience, energy efficiency, and sustainability issues, to name but a few. A smart city uses advanced technologies and a digital infrastructure to improve the outcomes in every aspect of a city's operations. A smart building optimizes the experience of occupants, staff, and management by using a modern and connected environment. Innovations in technology that can bring dramatic improvements to design, planning, and policy are critical in developing the cities and buildings of the future.

Author Benefits

Open Access: free for readers, with article processing charges (APC) paid by authors or their institutions.

High Visibility: indexed within SCIE (Web of Science), Scopus, Ei Compendex, Inspec, and other databases.

Journal Rank: JCR - Q2 (Construction and Building Technology) / CiteScore - Q1 (Architecture)
