Message from the Guest Editors

Dear Colleagues,

Large-scale public buildings significantly consume energy and emit high levels of carbon dioxide into the atmosphere. Taking China as an example, large public buildings consume about 600 billion kWh of electricity every year, accounting for about one-tenth of the total electricity consumption, and emit about 8% of carbon dioxide emissions and produces substantial air pollution. In total, 40%~60% of the energy is used to build a healthy, comfortable, and safe air environment. For a long period of time, significant energy consumption, huge space occupation by facilities and so on are serious problems in large public buildings.

In order to solve the problems of a built environment in large-scale public buildings, researchers and scholars are mainly focusing on the resistance and consumption reduction of HVAC transmission systems, efficient air distribution modes and air contaminants control. We hope that the publication of this Special Issue can lead to scientific and

Construction Engineering and Management Program, Department of Civil, Architectural, and Environmental Engineering, Illinois Institute of Technology, 3201 South Dearborn Street, Chicago, IL 60616, USA

Author Benefits

Open Access: free for readers, with the added environmental innovation and technology that can bring dramatic improvements to design, planning, and policy as critical in developing the cities and buildings of the future.

High Visibility: indexed with ISI/Scopus, CiteWeb, Scopus, and other databases.

Journal Rank: JCR - Q2 (*Engineering, Civil*) / CiteScore - Q1 (*Architecture*)

Message from the Editor-in-Chief

Current urban environments are home to multi-modal transit systems, extensive energy grids, a building stock, and integrated services. Sprawling neighborhoods are composed of buildings that accommodate living and working quarters. However, it is expected that the cities and communities of the future will face complex and enormous challenges, including maintenance, interconnectivity, resilience, energy efficiency, and sustainability issues, to name but a few. A smart city uses advanced technologies and a digital infrastructure to improve the outcomes in every aspect of a city's operations. A smart building optimizes the experience of occupants, staff, and management by using a modern and connected environment. Innovation and technology that can bring dramatic improvements to design, planning, and policy as critical in developing the cities and buildings of the future.
