Deadline for manuscript submissions: closed (30 September 2022)

Message from the Guest Editors

Dear Colleagues,

Supported metal catalysts are an important category of heterogeneous catalysts and are widely applied in various industrial chemical reactions. Metal–support interactions play essential roles in the dispersion of metals with a high surface area and the stabilization of metal particles during catalysis. Such interactions could also have a substantial impact on the shape of the metal particles (e.g., two dimensional versus three dimensional ones), thus tuning catalytic performance remarkably. Therefore, understanding metal–support interactions is essential for tuning the activity, selectivity and stability of oxidesupported metal catalysts.

This Special Issue is focused on, but not limited to, recent progress in characterization, understanding and application of metal–support interactions in heterogeneous catalysis.

Specialsue
