submissions:

31 October 2026

Message from the Guest Editor

Dear colleagues,

Maintaining lipid profiles such as high density lipoprotein and total cholesterol is essential to health not only human but also in animals. The aim of this special issue is to investigate the molecular mechanism of hyperlipidemia related genes and proteins such as ApoA-1 which is related to high density lipoprotein expression and to review the effect of diet and medication, and environmental factor to gene expression. Using the technique of metabolomics, metabolic biochemistry to investigate is welcome. We also welcome novel biomarker for early diagnosis and monitoring of hyperlipidemia related disease. Submissions are welcome on wide range of hyperlipidemia related endocrine disease such as diabetes mellitus, Cushing's disease, pancreatitis, gall bladder mucoceles.
