Exosomes in Tissue Regeneration and Disease Therapy

Message from the Guest Editor

Exosomes are tiny vesicles secreted by cells, with a diameter of about 30–150 nm, containing cell-specific proteins, lipids, and small molecules of nucleic acids, such as miRNA, mRNA, and lncRNA. In recent years, exosome-mediated intercellular communication has gained extensive attention in the development of human diseases. Many studies confirmed that exosomes have cardioprotective functions similar to stem cells, which can promote angiogenesis, reduce apoptosis, and minimize the damage caused by stress. Exosomes can also be used as drug carriers to treat diseases. Here, we are focus on the role of exosomes in stem cell-based bone regeneration, heart disease, and tumor development.

About the Journal

Message from the Editor-in-Chief

Editor-in-Chief

Prof. Dr. Madhav Bhatia

Department of Pathology and Molecular Medicine, University of Otago,
Christchurch 8140, New Zealand

Author Benefits

High Visibility:

indexed within Scopus, SCIE (Web of Science), PMC, PubMed, Embase, CAPlus / SciFinder, FSTA, AGRIS, and other databases.

Rapid Publication:

manuscripts are peer-reviewed and a first decision is provided to authors approximately 16.3 days after submission; acceptance to publication is undertaken in 2.8 days (median values for papers published in this journal in the second half of 2025).

Recognition of Reviewers:

APC discount vouchers, optional signed peer review, and reviewer names are published annually in the journal.
