Message from the Guest Editors

Dear Colleagues,

Urologic cancer research is a dynamic and critical field dedicated to unraveling the characteristics of tumors affecting the genitourinary system. Its primary aim is to develop our understanding in order to improve the management of these complex diseases.

Researchers tirelessly explore the intricate genetic and molecular mechanisms underlying the initiation and progression of urological cancers, paving the way for personalized diagnostic and therapeutic strategies. Robotic surgery has become widespread, with it already being a cornerstone in the treatment of many urologic malignancies. Continuous efforts are conducted by scientists to improve the accuracy of diagnostic tools, the efficacy and safety of medical treatments, the outcomes of surgical techniques, and ultimately, the patients' prognosis and quality of life.

In this Special Issue, we invite authors to submit papers on the recent advances and future perspectives of epidemiology, risk factors, pathophysiology, and the diagnosis and/or treatment of main urologic tumors.
