Message from the Guest Editor

Dear colleagues,

Stereotactic Body Radiation Therapy (SBRT) implies the delivery of large doses of radiation to very small volumes, in a very short period of time, using sophisticated technology to plan and to deliver the treatment. SBRT has become a valuable adjunct to standard surgery and chemotherapy in some situations, and a viable alternative to surgery in other situations. In a very short time, it has grown from being a highly specialized intervention practiced by only a few centres, becoming a modern standard-of-care at most academic centres. In doing so, SBRT has offered improved outcomes to our patients, and exciting new opportunities to our clinicians and researchers. The burden of cancer continues to grow as and our population continues to age. SBRT is a powerful weapon in our battle against cancers of all types.
