Message from the Guest Editor

Dear Colleagues,

Artificial Intelligence refers to the development and simulation of human intelligence processes by computer algorithms (systems) in diagnostic medicine, biology, public health, and other life sciences. A lung (pulmonary) nodule is an abnormal growth that forms in a lung and can then become cancerous. The clinical diagnosis of lung nodules is mainly based on imaging, including chest X-ray, computed tomography (CT), positron emission tomography (PET), and magnetic resonance imaging (MRI). Nevertheless, blood tests may identify benign lung nodules. This Special Issue invites scholars to apply up-to-date Artificial Intelligence methods to detect lung nodules in pulmonary medicine, thereby improving the efficacy and accuracy of clinical decisions.

Message from the Editor-in-Chief

You are cordially invited to submit research articles, short communications, comprehensive reviews, case reports or interesting images for consideration and publication in *Diagnostics* (ISSN 2075-4418). *Diagnostics* is published in open access format – research articles, reviews and other contents are released on the Internet immediately after acceptance. The scientific community and the general public have unlimited and free access to the content as soon as it is published. We would be pleased to welcome you as one of our authors.

Author Benefits

Open Access: free for readers, with article processing charges (APC) paid by authors or their institutions.

High Visibility: indexed within Scopus, SCIE (Web of Science), PubMed, PMC, Embase, Inspec, CAPlus / SciFinder, and other databases.

Journal Rank: JCR - Q1 (Medicine, General and Internal) / CiteScore - Q2 (Internal Medicine)
