Message from the Guest Editor

Dear Colleagues,

DSGE is the unifying framework for modeling dynamic economic phenomena in modern macroeconomics, and responsible for the New Neoclassical Synthesis in the field. The DSGE approach in macroeconomics has been a revolutionary innovation, which in turn has allowed macroeconomics to spread and take over other fields, including but not limited to labor, public economics, industrial organization, and environmental and climate economics.

In this Special Issue, *Economies* is inviting researchers and academicians to submit their work to a Special Issue dedicated to “**DSGE and Macroeconomics**”. Some of the topics that this issue might address include but are not limited to quantitative macroeconomics, monetary theory, RBC models, DSGE modeling, fiscal and monetary policies, and computational aspects of those (calibration, simulation, estimation). The papers can be theoretical or empirical, and the approach can be based on a case study, comparative or institutional analysis, theoretical contributions or empirical work, among others.
