Message from the Guest Editor

Flows of complex fluids occur in a variety of industrial applications, as well as in nature. From blood to plastic melts, the presence of microstructures such as polymers, proteins, and particles can promote nonlinear material properties, giving rise to intriguing flow behavior and transport dynamics. Among different rheological behaviors, viscoelasticity in particular may promote instabilities in nearly inertialess flows. Such instabilities can be driven solely by the non-Newtonian behavior of complex fluids such as polymer melts and solutions. This Special Issue of *Fluids* aims to collect recent theoretical, numerical, and experimental developments in this research field. Specific topics may include thermo-hydrodynamical instabilities, instabilities in shear or extensional flows, interfacial instabilities, instabilities in porous media, instabilities in Taylor–Couette flows, and transition to elastic turbulence.

Engineering, University of Bath,
Bath BA2 7AY, UK

Message from the Editor-in-Chief

Fluids (ISSN 2311-5521) is an international journal on all aspects of fluids in open access format: research articles, reviews and other contents are released on the internet immediately after acceptance. You are invited to contribute a research article or a comprehensive review for consideration and publication in *Fluids*. The scientific community and the general public have unlimited free access to the content as soon as it is published. Please consider *Fluids* as an exceptional, exciting enterprise ready to reward your trust, attention, and active participation.

Author Benefits

Open Access: free for readers, with article processing charges (APC) paid by authors or their institutions.

High Visibility: indexed within Scopus, ESCI (Web of Science), Inspec, CAPlus / SciFinder, and other databases.

Journal Rank: CiteScore - Q2 (*Mechanical Engineering*)
