Message from the Guest Editors

The origin and distribution of genetic diversity across landscapes determines the ability of forest tree species to sustain environmental change. Conifers are foundation species that cover large parts of the Northern Hemisphere and play a vital role in maintaining regional ecosystems. Despite their worldwide ecological and economic importance, conifer species have been understudied at the genomic level due in part to their large genome sizes. The rapid development of sequencing technologies and bioinformatics pipelines is providing unprecedented insights into the genome-wide genetic variation in conifers, aiding in understanding how their contemporary genetic variation has been shaped by various evolutionary forces, and how species respond to climate change challenges. This Special Issue is seeking contributions on genome-wide genetic diversity investigation in conifer species. These studies should provide important references for forest resource management, breeding and conservation actions.

Message from the Editorial Board

Forests (ISSN 1999-4907) is an international and cross-disciplinary, scholarly forestry journal. The distinguished editorial board and refereeing process ensures the highest degree of scientific rigor and review of all published articles. Original research articles and timely reviews are released online, with unlimited free access.

Our goal is to have *Forests* be recognized as one of the foremost publication outlets for high quality, leading edge research in this broad and diverse field. We therefore invite you to be one of our authors, and in doing so share your important research findings with the global forestry community.

Author Benefits

Open Access: free for readers, with article processing charges (APC) paid by authors or their institutions.

High Visibility: indexed within Scopus, SCIE (Web of Science), Ei Compendex, GEOBASE, PubAg, AGRIS, PaperChem, and other databases.

Journal Rank: JCR - Q1 (Forestry) / CiteScore - Q1 (Forestry)
