submissions:

30 September 2024

Message from the Guest Editors

The study of fractional-order systems has garnered significant attention due to their ability to provide more accurate descriptions of many real-world systems. The applications of fractional-order systems can be found in several areas such as signal processing, biomedical systems, signal processing, and so on. Fractional-order systems and control have become an area of active research and attention due to their potential to provide more accurate modeling and control solutions for various complex processes.

The key objective of this Special Issue is to compile a collection of articles that illustrate new developments and findings in the stabilization and tracking control of fractional-order systems. In this Special Issue, significant attention will be dedicated to discovering novel approaches, highlighting notable innovations in both the theoretical foundations and practical applications of fractional-order systems.
