Message from the Guest Editors

Dear Colleagues,

For the past three decades, the dictator game has emerged as a simple metric or baseline for studying human behavior, including generosity, fairness, reciprocity, social preferences, social norms, moral costs, charitable giving, contributions to public goods, market design, institutions, and gender differences, among many others. This Special Issue is looking for submissions that make novel contributions in this broad program by using dictator games. We welcome submissions using a variety of methods to study behavior in dictator games, including laboratory experiments, field experiments, theoretical analysis, and meta-analysis.
