Currently, the cut flower market appears to be generating much export revenue in the world flower market trade. The large cut flower exports have seen impressive increases in their good and qualified production in numerous countries. However, each of the flower species has a varied vase life and is subject to different export environmental controls under postharvest conditions. Thus, methods for prolonging flower vase life need to be studied, and the tools for postharvest treatment in the floral industry need to be optimized. Recent developmental methods in nanotechnology, thermal image analysis, UV-light application, and other technologies are realizing promising methods that could be applied for prolonging flower vase life. The purpose of this Special Issue is to present new factors, important techniques, and potential technologies for improving the postharvest quality of flowers, and new ideas or recommendations for handling postharvest mechanization in the flower industry.

Message from the Editor-in-Chief

Horticultural plants and their products provide sustenance, health, and beauty. A confluence of factors is putting increasing pressure on horticultural production to evolve, and innovative research is addressing these challenges. *Horticulturae* provides a venue to communicate research results in a rapid manner with open access, allowing everyone the opportunity to stay abreast of leading research addressing horticulture. I invite you to consider publishing the results of your research in this high quality, peer-reviewed journal.

Author Benefits

Open Access: free for readers, with article processing charges (APC) paid by authors or their institutions.

High Visibility: indexed within Scopus, SCIE (Web of Science), PubAg, AGRIS, FSTA, and other databases.

Journal Rank: JCR - Q1 (Horticulture) / CiteScore - Q2 (*Horticulture*)
