Emerging Biocide Resistance-Frequency, Drivers, Relevant Outcomes and Containment Strategies

Message from the Guest Editor

Biocidal products are relevant for the control of infections and should be used in a targeted way. During the pandemic, however, many hand and surface disinfectants were used in a general non-targeted way in public and private areas. Depending on the type of biocidal agents, exposure to subinhibitory concentration may cause an adaptive bacterial response resulting in a lower cellular susceptibility to the biocidal agent or to other biocidal agents, or even to antibiotics (cross-resistance). Potential topics include but are not limited to:

- Frequency and relevance of biocide resistance;
- Mechanisms of tolerance;
- Case reports (reduced cellular susceptibility, e.g., resulting in infection or food contamination);
- Adaptive cellular effects of excessive disinfection measures in public places;
- Evidence-based proposals for a targeted use of biocidal agents for the prevention of infectious disease;
- Relevance of antimicrobial surface coating on bacterial tolerance;
- Strategies for containment of biocide resistance;
- Relevance of biofilms for biocide resistance;
- Proposals for evidence-based definitions of biocidal tolerance and resistance.

Author Benefits

Open Access:

free for readers, with article processing charges (APC) paid by authors or their institutions.

High Visibility:

indexed within Scopus and other databases.

Rapid Publication:

manuscripts are peer-reviewed and a first decision is provided to authors approximately 21.1 days after submission; acceptance to publication is undertaken in 7.6 days (median values for papers published in this journal in the first half of 2024).
