Message from the Guest Editors

PHIR has been defined as the use of scientific methods to develop knowledge about program or policy interventions operating within or outside of the health sector and that have the potential to affect the distribution of health risk factors or determinants in a population. Population health interventions (PHIs) are generally complex. Moreover, boundaries between them and their implementation contexts are blurred, or even arbitrary. Research processes and methods then have to take into account the complexity and effect of the context on intervention implementation and outcomes. It is a question of designs and methods, but also of the focus of the research: beyond the results, analyses of mechanisms and of transferability factors are necessary. It is also a question of how to conduct research, e.g., in interdisciplinarity and in association with stakeholders. These statements call for reform of questions guiding both research and methods used to answer them.

Message from the Editor-in-Chief

Addressing the environmental and public health challenges requires engagement and collaboration among clinicians and public health researchers. Discovery and advances in this research field play a critical role in providing a scientific basis for decision-making toward control and prevention of human diseases, especially the illnesses that are induced from environmental exposure to health hazards. *IJERPH* provides a forum for discussion of discoveries and knowledge in these multidisciplinary fields. Please consider publishing your research in this high quality, peer-reviewed, open access journal.

Author Benefits

Open Access: free for readers, with article processing charges (APC) paid by authors or their institutions.

High Visibility: indexed within Scopus, PubMed, MEDLINE, PMC, Embase, GEOBASE, CAPus / SciFinder, and other databases.

Journal Rank: CiteScore - Q1 (Public Health, Environmental and Occupational Health)
