Message from the Guest Editor

The study of the association between surrounding greenness exposure and human health has recently gained extensive attention. Although *green space has* been revealed to be positively associated with a wide range of *health* benefits (physical and mental), multiple studies have revealed inconsistent results. Thus, more research related to surrounding greenness exposure and its effects on human health is necessary. Another issue is that the use of personal monitoring to acquire the surrounding greenness exposure for large-scale epidemiological studies is currently not feasible. Therefore, to represent individuals' exposure, it is essential to utilize spatial informatics technologies such as remote sensing and geographic information systems for mapping and analysis of green space at various temporal and spatial scales. This topical collection is open to the subject area of greenness epidemiology involving spatial informatics technologies.

Message from the Editor-in-Chief

Addressing the environmental and public health challenges requires engagement and collaboration among clinicians and public health researchers. Discovery and advances in this research field play a critical role in providing a scientific basis for decision-making toward control and prevention of human diseases, especially the illnesses that are induced from environmental exposure to health hazards. *IJERPH* provides a forum for discussion of discoveries and knowledge in these multidisciplinary fields. Please consider publishing your research in this high quality, peer-reviewed, open access journal.

Author Benefits

Open Access: free for readers, with article processing charges (APC) paid by authors or their institutions.

High Visibility: indexed within Scopus, PubMed, MEDLINE, PMC, Embase, GEOBASE, CAPlus / SciFinder, and other databases.

Journal Rank: CiteScore - Q1 (Public Health, Environmental and Occupational Health)
