Message from the Guest Editors

Advanced oxidation processes (AOPs) can be generally applied for the decontamination of water and wastewater. They are important in the effective removal of emerging contaminants, such as pharmaceuticals and personal care products (PPCPs) and other priority pollutants. AOPs can transform toxic biorecalcitrant compounds and recalcitrant wastewaters into more biodegradable byproducts. AOPs may possibly include photocatalysis (using solar radiation, LEDs), Fenton-based processes, electrochemical processes, wet air and catalytic wet peroxide oxidation and combinations with biological and membrane processes. The integration of AOPs with more established processes such as ozonation, filtration, adsorption and using renewable energy sources such as solar light can provide a major opportunity to reduce the overall effort of disinfection, water and wastewater treatment processes.

Within this context, we would like to invite you to contribute to this issue and to disseminate cutting-edge findings on water and wastewater decontamination.

Message from the Editor-in-Chief

Addressing the environmental and public health challenges requires engagement and collaboration among clinicians and public health researchers. Discovery and advances in this research field play a critical role in providing a scientific basis for decision-making toward control and prevention of human diseases, especially the illnesses that are induced from environmental exposure to health hazards. *IJERPH* provides a forum for discussion of discoveries and knowledge in these multidisciplinary fields. Please consider publishing your research in this high quality, peer-reviewed, open access journal.

Author Benefits

Open Access: free for readers, with article processing charges (APC) paid by authors or their institutions.

High Visibility: indexed within Scopus, PubMed, MEDLINE, PMC, Embase, GEOBASE, CAPlus / SciFinder, and other databases.

Journal Rank: CiteScore - Q1 (Public Health, Environmental and Occupational Health)
