Message from the Guest Editor

Dear Colleagues,

Despite important progress, the speed with which malnutrition is being reduced is insufficient to deliver on Sustainable Development Goal (SDG) 2: End Hunger, and Target 2.2 which aims to end all forms of malnutrition by 2030.

Malnutrition is a state of nutrition in which a deficiency or excess of energy, protein and other nutrients causes measurable adverse effects on the body tissues and form (body shape, size and composition) and function and clinical outcome. Up to 811 million people are estimated to be undernourished and about 2 billion are either overweight or obese. Covid-19 epidemic exacerbated the issue of malnutrition and the effects will be more profound in the years to follow the Covid-19 epidemic.

Message from the Editor-in-Chief

Addressing the environmental and public health challenges requires engagement and collaboration among clinicians and public health researchers. Discovery and advances in this research field play a critical role in providing a scientific basis for decision-making toward control and prevention of human diseases, especially the illnesses that are induced from environmental exposure to health hazards. *IJERPH* provides a forum for discussion of discoveries and knowledge in these multidisciplinary fields. Please consider publishing your research in this high quality, peer-reviewed, open access journal.

Author Benefits

Open Access: free for readers, with article processing charges (APC) paid by authors or their institutions.

High Visibility: indexed within Scopus, PubMed, MEDLINE, PMC, Embase,

GEOBASE, CAPlus / SciFinder, and other databases.

Journal Rank: CiteScore - Q1 (Public Health, Environmental and Occupational Health)
