The Health-Related Quality of Life of Older People with Chronic Disease

Message from the Guest Editors

The world's population is aging at an unprecedented rate, and this demographic transition is fundamentally reshaping societies worldwide, with a more pronounced impact in Europe. The World Health Organization (WHO) states that the global population aged 60 and over is projected to double by 2050, reaching nearly 2.1 billion people. This trend of aging poses challenges and opportunities for governments, health systems, and communities around the world. As people age, they often experience several physical and cognitive health problems that can affect their overall well-being. Quality of life is a complex concept that includes physical health, mental well-being, social engagement, and overall satisfaction with one's living environment. It is crucial to prioritize a high quality of life for older adults with chronic diseases, not only as a moral obligation but mainly as an indicator of a society's progress and commitment to caring for its older population. In this context, papers addressing the health-related quality of life of older people with chronic disease are invited for this Special Issue.

About the Journal

Message from the Editor-in-Chief

Addressing the environmental and public health challenges requires engagement and collaboration among clinicians and public health researchers. Scientific discoveries and advances in this research field play a critical role in providing a rational basis for informed decision-making toward control and prevention of human diseases, especially the illnesses that are induced from environmental exposure to health hazards.

IJERPH provides a forum for discussion of discoveries and knowledge in these multidisciplinary fields. Please consider publishing your research in this high quality peer-reviewed journal.
