

Special Issue

Healthcare and Quality of Life of Patients with Cancer

Message from the Guest Editors

Cancer-related challenges could trigger a negative or positive reaction, with different intensities depending on individual characteristics. Various factors, such as coping strategies, perceived social support, and socioemotional abilities, could contribute to and mediate the relationship between the impact of trauma and the occurrence of positive or negative psychological outcomes. The available evidence seems to show that maladaptive coping strategies, low levels of perceived social support, and reduced socioemotional skills can bring the individuals to experience greater distress, whereas adaptive coping strategies, adequate perceived social support, and preserved socioemotional abilities can result in positive psychological outcomes in patients with cancer. In this Special Issue, papers investigating the abovementioned factors in patients with cancer are invited. Original research articles, reviews, method papers, and case reports are welcome.

About the Journal

Message from the Editor-in-Chief

Addressing the environmental and public health challenges requires engagement and collaboration among clinicians and public health researchers. Scientific discoveries and advances in this research field play a critical role in providing a rational basis for informed decision-making toward control and prevention of human diseases, especially the illnesses that are induced from environmental exposure to health hazards.

IJERPH provides a forum for discussion of discoveries and knowledge in these multidisciplinary fields. Please consider publishing your research in this high quality peer-reviewed journal.
