

# Joint Special Issue

## Information for Business and Management–Software Development for Data Processing and Management, 2nd Edition

### Message from the Guest Editor

Today, data and information are among the most important resources in various aspects of our life. Data and information are created, generated, collected, stored, and then processed and shared in various ways. All these activities are performed with the participation of contemporary software, applications, IT systems and their components. Thus, in addition to creating the software itself, it is becoming increasingly important to manage the data and information that the software uses, processes and stores. Hence, it is extremely important not only the software itself and the process of its development, but also information management at the appropriate level, while maintaining a sufficiently high level of data protection, information and its flow. Therefore, this Special Issue aims to show various aspects of software creation and development, designed for fast, easy and secure processing and management of data and information. The areas of this Special Issue are listed below:

- Software engineering
- Requirements engineering
- Data processing and management
- Knowledge management
