Message from the Guest Editors

Earth retaining walls (ERWs) are ubiquitous in the civil engineering landscape. Many different types of wall solutions are available to designers, with advantages and disadvantages depending on the application. Design methodologies for these structures are well-established and proven. ERWs can be broadly classified into conventional (cantilever and gravity) and mechanically stabilized earth (MSE) categories. However, there are other (even particular-specific) different wall types that can be designed to perform the same function. The use of new structural materials and construction processes to optimize ERW systems, as well as the use of marginal fills as well as recycled materials as backfill, are key topics of interest in the field.

Message from the Editor-in-Chief

You are invited to contribute a research article, review or short communication for consideration and publication in *Infrastructures* (ISSN 2412-3811). There is no restriction on the length of the papers. *Infrastructures* is published in open access format. The scientific community and general public have unlimited free access to the content as soon as it is published. *Infrastructures* is supported by the authors by the payment of article processing charges for accepted manuscripts. Please consider *Infrastructures* as an exceptional opportunity to publish your work.

Author Benefits

Open Access: free for readers, with article processing charges (APC) paid by authors or their institutions.

High Visibility: indexed within Scopus, ESCI (Web of Science), Inspec, and other databases.

Journal Rank: JCR - Q2 (Construction and Building Technology) / CiteScore - Q1 (Building and Construction)
