Message from the Guest Editors

Dear Colleagues,

Semiconductor photocatalysis is a potential means of clean energy production and environmental remediation. Perovskite materials have been studied for decades as semiconductor photocatalysts. Recent advancements in materials chemistry have expanded the availability of perovskite materials from traditional metal oxides to non-oxides, which include mixed anion compounds and organic-inorganic hybrids toward efficient utilization of visible light—the main component of the solar spectrum. The performance of perovskite-related photocatalysts can be improved in different ways, for example, through morphological control of the photocatalyst and band-engineering by compositional control. As such, perovskite photocatalysts have attracted considerable attention in many areas including inorganic chemistry, catalysis, materials science, photochemistry, and so on. This Special Issue will collect research and review contributions that focus on recent progress in perovskite-related photocatalysts.

Message from the Editor-in-Chief

Inorganic chemistry remains a lynchpin of modern chemistry, not only embracing the function and reactivity of combinations of most elements of the periodic table, but also providing a footing for studies of materials, catalysts, drugs, fuels and industrial chemicals. Arguably, the role and reach of inorganics in society have never been as great as today. Adventurous research at the heart and at the extremes of inorganic chemistry is vital to further advances and *Inorganics* offers authors the opportunity to publish exciting new research in an open access format.

Author Benefits

Open Access: free for readers, with article processing charges (APC) paid by authors or their institutions.

High Visibility: indexed within Scopus, SCIE (Web of Science), CAPlus / SciFinder, and other databases.

Journal Rank: JCR - Q2 (*Chemistry, Inorganic and Nuclear*) / CiteScore - Q2 (*Inorganic Chemistry*)
