### Message from the Guest Editors

Dear Colleagues,

The recent unsustainable colony loss rates and deterioration of honey bee health observed globally call for adequate mitigation measures. Evidence-based solutions are key to solving these issues. Thus, research plays a central role in providing fundamental and practical knowledge to design strategies needed to combat poor colony health.

With this in mind, we decided to create a new Special Issue (SI) focusing on solutions to enhance sustainable beekeeping. Via this SI, we will consider research articles and reviews of various disciplines related to the beekeeping of *Apis* spp. (including *Apis mellifera* and any of the Asian honey bees). Our primary aim is to improve bee management. Topics of particular interest include health monitoring, socio-economics, mitigation of stressors, and improvement of pest control and precision beekeeping. However, candidate authors may also submit articles related to other topics.
