Message from the Collection Editors

Dear Colleagues,

Hemiptera is one of the largest insect orders playing an important role in both natural and anthropogenic ecosystems. Numerous phytophagous hemipterans cause serious damage to agriculture and forestry, whereas some predatory species are widely used as biocontrol agents. Therefore, investigations conducted on Hemiptera are of interest for both fundamental and applied entomology. This Special Issue aims to represent the current state of the studies on Hemiptera ecology and physiology. Both original research articles and reviews can be submitted; studies on ecophysiology (regulation of seasonal cycles, reproduction, feeding, locomotion, etc.) are particularly welcome; preference will be given to the papers concerning economically important species (both pests and beneficial ones). We look forward to receiving your valuable contributions.
