Pneumology, GRN Hospital
Weinheim, 69469 Weinheim,
Germany

Deadline for manuscript
submissions:

31 March 2025

Message from the Guest Editors

Atherosclerotic peripheral artery disease (PAD) is a major manifestation of cardiovascular disease. More than 200 million individuals worldwide suffer from PAD and such patients have amongst the highest morbidity and mortality rates. In addition, the associated costs are even higher than after stroke, as shown in recent population-based studies.

Recent advances, including antiplatelet and lipid-lowering therapies, along with innovations in endovascular treatment, such as thrombectomy, atherectomy, and lithotripsy, have created great opportunities to improve treatment algorithms in PAD and, possibly, patient related outcomes. Nonetheless, there is a clear need for novel evidence-based treatment strategies to effectively treat PAD patients and reduce the burden of the disease. These encompass pharmacologic as well as endovascular and surgical strategies. PAD treatment has been the focus of major global efforts to improve diagnostic, therapeutic, and preventive strategies.

The aim of our Special Issue is, thus, to collect original articles and reviews investigating pathophysiologic, diagnostic, and therapeutic aspects related to the management of PAD.
