Message from the Guest Editor

Dear Colleagues,

In recent years, several advancements have been made in the field of electrophysiology, and these are leading to changes in patient management. In particular, the use of zero-fluoroscopy, ultradensity mapping and new energy forms for complex arrhythmia ablation is increasing, conferring obvious advantages for patients.

This Special Issue will be focused on innovation in the field of electrophysiology, on the clinical relevance of novel methods acquired thus far, and on the near-future perspectives derived by changes in the management of patients.

Prof. Dr. Matteo Bertini
