### Message from the Guest Editors

Dear Colleagues,

Cardiovascular medicine and surgery remain at the forefront of clinical innovation in the midst of a rapidly evolving field of medicine at large. With the advent of digital technology, the pace at which novel techniques and knowledge are introduced to specialties is increasing exponentially.

In the last several years, there have been many major milestones that have changed the delivery of cardiovascular care to patients, including transcatheter valves or structural heart interventions, non-invasive digital hemodynamic monitors, minimally invasive surgical platforms, and artificial intelligence.

This Special Issue of *JCDD* will highlight and showcase the latest innovations that are promoting the most advanced iterations of clinical research and experimental concepts in cardiovascular specialties.
