Deadline for manuscript
submissions:

31 December 2024

Message from the Guest Editor

Dear Colleagues,

In recent years, significant attention has been paid to composite materials due to escalating concerns regarding the environment, performance, quality and so forth. It is clear that tailor-made materials that offer ecological efficiency, green chemistry, renewable resources, sustainable manufacturing, and high performance are key to the development of novel fabrication methods and processing and characterization techniques that offset the use of conventional composites.

We thus invite researchers to contribute original research and review articles that will enhance our basic knowledge of the subject and lead to the development of novel technologies and innovations in this field. We are particularly interested in articles that describe new or modified processes for the development/production/characterization of composites materials.

I look forward to receiving your contributions.
