Message from the Guest Editors

The Special Issue, “Composite rock mechanics and engineering”, aims to showcase the latest advances in geo-composite rock materials, with a specific focus on the failure rationale of different composited mineral particles on a macro-micro scale. Reinforcement techniques for ground and underground engineering, collapse monitoring and early warning in rock engineering, and stress measurement in rock, rock blasting and rock crushing engineering, and utilizations of different composite structures (such as reinforced concrete, composite metal mesh, steel and plastic support, etc.) are very important. High-end properties, such as strength, stiffness, impact resistance, and fatigue life, bearing a dynamic load capacity, are integral to the tunnel and other underground space. Original research papers, short communications, and review articles are solicited for this Special Issue.
