### Message from the Guest Editors

The aim of this Special Issue is to invite original articles, notable clinical findings, and review articles to discuss the latest advancements of research and clinical experience with respect to the reconstruction of peripheral nerve lesions. A variety of questions come to mind, only to name a small selection: which diagnostic/imaging tools are valid? What can be achieved with interfascicular neurolysis? Can axons travel for distances longer than 30 cm and promote meaningful function? What is the relevance of contralateral nerve transfers? Where is the time limit for nerve reconstruction of high lesions and when should we opt for nerve/muscle transfers? Are artificial nerve guides a realistic alternative when compared to conventional nerve grafts? With this Special Issue, we invite specialists of all faculties to contribute to this exciting field of research.
