

## Special Issue

# Glutamate Receptors

### Message from the Guest Editors

So far, eight different mGluR subtypes have been cloned and characterized that are located either in the perisynaptic annulus or on presynaptic terminals and have diverse neuroanatomical distributions and unique pharmacological and intracellular signaling properties. The mGluRs can be divided into Group I (mGlu1 and mGlu5), Group II (mGlu2 and mGlu3), and Group III (mGlu4, mGlu6, mGlu7, and mGlu8). Group I mGluRs, particularly mGluR5, are positively coupled to N-methyl-D-aspartate receptor (NMDAR) function and the Homer family of proteins. Group I mGluRs are rarely found presynaptically. Presynaptically localized Group II and Group III mGluRs, notably mGluR2 and mGluR3, are the classic inhibitory autoreceptors that suppress excess glutamate release from the presynaptic terminal. In recent years, positive allosteric modulators of mGluRs have also been synthesized. These compounds are an exciting advance for the development of novel therapeutic agents for increasing the activity of mGluR subtypes. All authors are cordially invited to contribute original research papers or reviews that target mGluRs to this Special Issue of *Life*.

## About the Journal

### Message from the Editor-in-Chief

*Life* (ISSN 2075-1729) is an international, peer-reviewed open access journal that publishes scientific studies related to fundamental themes in life sciences. Some papers are published individually, while others are submitted for inclusion in special issues with guest editors. You are invited to contribute a research article, essay, or a review to be considered for publication.

### Author Benefits

#### Open Access:

free for readers, with article processing charges (APC) paid by authors or their institutions.

#### High Visibility:

indexed within Scopus, SCIE (Web of Science), PubMed, PMC, CAPIus / SciFinder, AGRIS, and other databases.

#### Journal Rank:

JCR - Q1 (Biology) / CiteScore - Q1 (Paleontology)
