Message from the Guest Editors

Atrial fibrillation is the most frequent arrhythmia with rising incidences with age. Ten percent of the older population beyond the age of 70 years is supposed to present or suffer from atrial fibrillation. However, the clinical presentation of atrial fibrillation is unpredictable, with a huge spectrum from asymptomatic to severe ill patients. It remains unclear why some patients feel a strong sense of suffering and others do not, even if the general conditions and ECG presentation are completely identical.

It is still a 20-year-old study, the AFFIRM study, that sets the guardrails in the treatment of AF and divides patients into two simple categories: patients receiving rate-controlling treatment and patients receiving rhythm-maintaining treatment. Of course, atrial fibrillation is both a disease in its own right and a symptom that can occur in many, perhaps all, common cardiac conditions.

The aim of this Special Issue is to shed light on new aspects of the pathomechanism, various manifestations, and the challenges of clinical daily practice of atrial fibrillation.

Message from the Editor-in-Chief

You are invited to contribute a research article or a comprehensive review for consideration and publication in *Medicina* (ISSN: 1648-9144). *Medicina* is an open access, peer-reviewed scientific journal that publishes original articles, critical reviews, research notes, and short communications on medicine. The scientific community and the general public can access the content free of charge as soon as it is published.

Author Benefits

Open Access: free for readers, with article processing charges (APC) paid by authors or their institutions.

High Visibility: indexed within Scopus, SCIE (Web of Science), PubMed, MEDLINE, PMC, and other databases.

Journal Rank: JCR - Q1 (Medicine, General and Internal) / CiteScore - Q1 (General Medicine)
