Message from the Guest Editor

Periodontitis is a chronic multifactorial disease caused by bacterial infection that elicits an immune response of the host. This inflammatory disease is affected by patient related factors that interfere with the development and progression of periodontal lesions. The response of this tissue to injury has been studied at a molecular level, and soluble biological markers have been detected in gingival crevicular fluid and saliva allowing researchers and clinicians to describe the actual status of the periodontal condition.

In recent years, the concept of personalized medicine has been raised. This approach contemplates the integration of data on patient-related factors with those coming from the analysis of soluble biomarkers, with the aim to reduce diagnostic, therapeutic, and maintenance programs according to the biological and clinical specificity of each patient.

This Special Issue of *Medicina* welcomes the submissions that investigate the pathogenetic mechanism and patient-related factors affecting periodontal disease as well as clinical procedures proposed with a view to personalized diagnostic and therapeutic protocols.

Message from the Editor-in-Chief

You are invited to contribute a research article or a comprehensive review for consideration and publication in *Medicina* (ISSN: 1648-9144). *Medicina* is an open access, peer-reviewed scientific journal that publishes original articles, critical reviews, research notes, and short communications on medicine. The scientific community and the general public can access the content free of charge as soon as it is published.

Author Benefits

Open Access: free for readers, with article processing charges (APC) paid by authors or their institutions.

High Visibility: indexed within Scopus, SCIE (Web of Science), PubMed, MEDLINE, PMC, and other databases.

Journal Rank: JCR - Q1 (Medicine, General and Internal) / CiteScore - Q1 (General Medicine)
