Message from the Guest Editor

Dear Colleagues,

The importance of lung disease has grown with the emergence of COVID-19. Even beyond the context of the pandemic, however, it is widely hypothesized that the mortality rate of COPD patients will be the third highest in the world by 2030. Similarly dismal predictions are being made about lung disease and lung cancer patients. As such, in this Special Issue, we will focus on new nutritional approaches to lung cancer, COPD, and aspiration pneumonia, paying attention not only to conventional treatments but also to treatment methods using nutrients, case reports on lung diseases, and the causes of lung diseases. In addition, especially for lung cancer, we would like to ask you to focus not only on lung cancer per se but also on new storage alternative therapies for cancer in general, incorporating content that will lead to the treatment of lung cancer.
