Message from the Guest Editor

Dear Colleagues,

Metallic alloys are predominantly utilized in the industrial sectors. The microstructural evolution of alloys during processing and service has a significant role on determining the overall performance of the materials. As metallic materials in practical applications are subjected to cyclic loading, their fatigue resistance is a highlighted topic. Statistical data and multiscale models can make it easier to predict the fatigue behavior of metallic alloys when subjected to periodic loads. The numerical quantification of fatigue-based damage accumulation, failures, and crack growth will enable the design of highly reliable devices. This Special Issue is aimed at recent advances in experimental data, computational models, and statistical models that are utilized to describe the microstructural evolution and fatigue behavior of multicomponent metallic alloys. Of particular interest are the insights into microstructure-based fatigue life models for multicomponent metallic alloys.

Message from the Editorial Board

Metallic materials play a vital role in the economic life of modern societies; contributions are sought on fresh developments that enhance our understanding of the fundamental aspects related to the relationships between processing, properties and microstructure – disciplines in the metallurgical field ranging from processing, mechanical behavior, phase transitions and microstructural evolution, nanostructures, as well as unique metallic properties – inspire general and scholarly interest among the scientific community.

Author Benefits

Open Access: free for readers, with article processing charges (APC) paid by authors or their institutions.

High Visibility: indexed within Scopus, SCIE (Web of Science), Inspec, Ei Compendex, CAPus / SciFinder, and other databases.

Journal Rank: JCR - Q2 (Metallurgy and Metallurgical Engineering) / CiteScore - Q1 (Metals and Alloys)
