Message from the Guest Editor

Dear Colleagues,

Nickel-based superalloys and titanium alloys are widely used to fabricate key components for aerospace and aeroengines. With the increase in the requirements regarding performance and temperature, a significant amount of attention has been given to alloy design and microstructure control for nickel-based superalloys and titanium alloys. With the aim to encourage the application of the latest research findings in the field of aerospace and aeroengines, this Special Issue mainly focuses on microstructure control (including phase transformation mechanism, texture evolution, recrystallization, etc.) during thermal manufacturing (hot forging, rolling, extruding, etc.) and serving processes (tension, compression, creep, etc.). Additionally, papers that describe research work on alloy design, such as composition optimization, interstitial element control, and multiscale calculation, are also invited to this issue.

Message from the Editorial Board

Metallic materials play a vital role in the economic life of modern societies; contributions are sought on fresh developments that enhance our understanding of the fundamental aspects related to the relationships between processing, properties and microstructure – disciplines in the metallurgical field ranging from processing, mechanical behavior, phase transitions and microstructural evolution, nanostructures, as well as unique metallic properties – inspire general and scholarly interest among the scientific community.

Author Benefits

Open Access: free for readers, with article processing charges (APC) paid by authors or their institutions.

High Visibility: indexed within Scopus, SCIE (Web of Science), Inspec, CAPlus / SciFinder, and other databases.

Journal Rank: JCR - Q2 (*Metallurgy and Metallurgical Engineering*) / CiteScore - Q1 (Metals and Alloys)
