Deadline for manuscript  
submissions:

**closed (30 June 2024)**

### **Message from the Guest Editor**

Dear Colleagues, Glioblastoma is a diffusely infiltrative malignant brain tumor that leads to significant morbidity and mortality among affected patients. The new 2021 WHO Classification of Tumors of the Central Nervous System opened new horizons in molecular changes and in clinical and surgical practice. Due to the extremely poor prognosis, it is imperative to investigate new and altered molecular mechanisms that may be involved in glioblastoma pathogenesis. This special issue covers all aspects of glioblastoma, including surgical innovations, original research on current and experimental treatment options, studies on molecular characteristics of glioblastoma, as well as mechanisms underlying growth inhibition: apoptosis, autophagy, necrosis. Original papers, systematic reviews, meta-analyses and quality-of-life focused stereotactic radiosurgery, brain surgery, interstitial laser thermotherapy and oncology studies on this topic of interest are welcome.
