Message from the Guest Editor

In this Special Issue of *Nutrients*, we would like to bring together papers focusing on the topic of the influence of fat-soluble vitamins (A, D, E and K) on health outcomes. Fat-soluble micronutrient deficiencies have been associated with unfavourable health outcomes and various diseases such as cancer, diabetes, cardiovascular and liver diseases. Fat-soluble vitamins have a multitude of functions, including important immunomodulatory, inflammatory, and antioxidant-related processes, and deficiencies in these vitamins can contribute to, amongst others, the weakening of the immune system.

There is growing interest in the influence of fat-soluble micronutrients in both the prevention and management of disease. This interest is driven by the knowledge of the many biochemical functions of these essential nutrients but also by emerging pleiotropic processes.

Manuscripts presenting basic, applied, and clinical research, observational, and meta-analysis studies, and analytical reviews in the fat-soluble vitamins area are encouraged for this Special Issue.

an Open Access Journal by MDPI
